

Mushrooms nomenclatural novelties no. 3

Effectively published 2017-07-01 20:09:08 (ISSN 2560-9548)

Author : Serge Audet

Dentiporus Audet, gen.nov.

IF552848

It differs from *Antrrodia* s. str. by basidiomata smaller up to 3 cm, only resupinate, relatively soft, by thicker dissepiments in young basidiomata (comparable to pore diameter) becoming irpicoid with age, by skeletal hyphae with capillary to distinct lumen, by uninucleated basidiospores cylindrical not bent near apiculus and with a rounded distal end.

Holotype : *Antrrodia albidoides* A. David & Dequatre, *Mycol. helv.* **1**(6): 361 (1985).

Comment: The new genus is supported by the molecular analyses in Ortiz-Santana et al. 2013 (*Mycologia* 105 (6): 1391-1411) and Spirin et al. 2016 (*Mycologia* 105(6):1555–1576).

Etymology: the part name *denti* from *dens-dentis* = tooth is derived from Latin and refers to the dissepiments becoming irpicoid with age and *porus*=pore.

Dentiporus albidoides (A. David & Dequatre) Audet, comb.nov.

IF552849

Basionym : *Antrrodia albidoides* A. David & Dequatre, *Mycol. helv.* **1**(6): 361 (1985).
